**Dichondra repens**  
*Kidney Weed, Kidney Grass*

### Description

An attractive native groundcover often used as a lawn alternative in moist, shady areas. Leaves are small, fresh green in colour and kidney-shaped. The vigorous, creeping habit results in a dense mat that hugs the ground and spreads readily. Good for planting between pavers, as a ground stabiliser on embankments, or in hanging baskets. Adaptable to most climates and tolerates full sun to 80% shade. Prefers a well-drained, moist soil. Low maintenance but can be mowed if necessary.

### Specifications

| Dimensions  | Height: 0.1 to 0.15m, Width: 0.5m |
| Aspect:     | Part shade                        |
